RHITAM SAHOO: ROLL-2568; ID-2022-1146

MIDNAPORE COLLEGE (AUTONOMOUS)

MIDNAPORE, PASCHIM MEDINIPUR

CANDIDATE'S DECLARATION

I hereby certify that the work which is being presented in the report entitled “**Hospital Management System**” by “Anwesha Ghosh, Ritam Sahoo, Sutapa Nandi, Durgadas Maity” to the Department of Computer Application at MIDNAPORE COLLEGE affiliated to VIDYASAGAR UNIVERSITY, is an authentic record of my own work carried out during a period from 30 September, 2024 to 20 May, 2025 under the supervision of Shilpi Das (Faculty member, Computer Application). The matter presented in this project report has not been submitted by me in any other University / Institute.

This is to certify that the above statement made by the candidate is correct to the best of my/our knowledge.

Date:

Date:

CERTIFICATE

I hereby certify that the work which is being presented in the M.Sc. Project Report entitled “HOSPITAL MANAGEMENT SYSTEM” in partial fulfilment of the requirements for the award of the Bachelor of Computer Application and submitted to the Department of computer application of Midnapore College (Autonomous) is an authentic record of my own work carried out during a period from September 2024 to May 2025 under the supervision of Mrs.SHILPI DAS, computer application.

Signature of the Candidate

This is to certify that the above statement made by the candidate is correct to the best of my knowledge.

Signature of the Supervisor

Date:

MRS.SHILPI DAS
FACULTY MEMBER
Dept. of Computer Application

ACKNOWLEDGEMENT

I would like to place on record my deep sense of gratitude to our supervisor Shilpi Das (Faculty member, Computer Application), Midnapore College (Autonomous), Paschim Medinipur, West Bengal, India for his generous guidance, continuous encouragement and supervision throughout the course of present work.

I also wish to extend my thanks to our Teacher in Charge, Mr. Satyaranjan Ghosh for providing us infrastructural facilities to work in, without which this work would not have been possible.

Sutapa, Roll:

2597,

Durgadas Maity:

2580

HOSPITAL MANAGEMENT SYSTEM

ABSTRACT

Hospital management system is a distributed web Application developed to maintain the details of hospital in any hospital. Hospital management system is a computerized system designed and programmed to deal with day-to-day operations taking place. The program can look after inpatients, outpatients, records, database treatments, status illness, billings in the pharmacy and labs all assets in the Hospital. It also maintains hospital information such as ward id, doctors in charge and department administering. The purpose of the project is to computerize the Front Office Management of Hospital to develop software which is user friendly, simple, fast, and cost – effective. It deals with the collection of patient’s information, diagnosis details, etc. Traditionally, it was done manually or using outdated System. The project outlines all the process followed to come up with the software that is from analysis to testing the system.

1.Introduction

Hospitals have complex security and operational needs. Hospital premises serve hundreds and thousands of patients and their visitors every day. Managing these visitors and patients at the reception area with the paper-based system is tedious and nonsecure. The reception management is one way to manage these visitors in the reception area. With technological advancement, management systems enable a contactless visitor check-in experience by replacing paper logbooks. This hospital software makes managing visitor check-ins easy and secure for Hospitals. Hospital Reception Management System is crucial technology components that enable a single outlet or enterprise to better serve its hospital with beverage transactions and control Telecommunication hospital. The main aim of this project is computerization of all processes which happens in the Hospitals. It is a database system for creating a selective retrieved of information for subsequent analysis, manipulation and application. Hospital Management System helps the hospital manager to manage the hospital more effectively and efficiently by computerizing orders, billing and patient details control. The Hospital Management System enables you to improve your organization and improve its efficiency and quality of work. Proper management of the processes that are essential to the success of the hospital helps you to manage your processes.

2.PURPOSE

This software will help the company to be more efficient in registration of their patients and manage appointments, records of patients. It enables doctors and admin to view and modify appointments schedules if required. The purpose of this project is to computerize all details regarding patient details and hospital details.

- **Why Does Hospital needs a Management System?**

Technological enablement, digitization, and automation affect industries today in profound ways. Healthcare delivery is no exception.

Populations around the world are getting older, and their treatment needs are becoming more complex, and so are the care delivery strategies. The paradigm of healthcare delivery is changing, and the changes will likely accelerate in the years ahead. Against this backdrop, hospitals—traditional healthcare centres—seek to redefine themselves into a decentralized ecosystem of 360-degree care delivery.

Another reason that calls for the need for hospital management systems is a staff deficit– predicted to be some 18 million workers worldwide by 2030. This alarming reason has put hospitals under huge pressure with the shift from health treatment to health management and is leaving hospitals struggling to keep up. Energy costs are rising, there is continual pressure to decarbonize, and patients – are now accustomed to managing their lives in a digital, app-based environment

2.1 SCOPE

The system will be used as the application that serves hospitals, clinic, dispensaries or other health institutions. The intention of the system is to increase the number of patients that can be treated and managed properly. If the hospital management system is file based, management of the hospital has to put much effort on securing the files. They can be easily damaged by fire, insects and natural disasters. Also, could be misplaced by losing data and information.

2.2 DEFINITIONS, ACRONYMS, and ABBREVIATIONS

1. Cardiologist - treats heart disease.
2. Gynaecologist – treat issues related to the uterus, fallopian tubes, ovaries, and breasts.

3. Neurologist – treat disorders of the nervous system (brain, spinal cord, and nerves).

4. Ophthalmologist - treats eye defects, injuries, and diseases.

- **SRS:** Software Requirement Specification.
- **DFD:** Data Flow Diagram.

✓ **Sign up** - Creating New User.

✓ **Log in** - Logging in Existing User.

✓ **PhNo** - Mobile number.

✓ **Addr** – Address.

✓ **Expr** – Experience.

Advantages

- The system automates the manual procedure of managing hospital activities.
- Doctors can view their patients' treatment records and details easily.
- It even generates an instant bill.
- The system is convenient and flexible to be used.
- It saves their time, efforts, money and resources.

Disadvantages

- Requires large database.
- The admin has to manually keep updating the information by entering the details in the system.
- Need Internet connection.

3. Product Perspective

This Hospital Patient Info Management System is a self-contained system that manages activities of the hospital. Due to improperly managed details medical center faces quite a lot of difficulties in accessing past data as well as managing present data. The fully functional automated hospital management system which will be developed through this project will eliminate the disadvantages caused by the manual system by improving the reliability, efficiency and performance. The usage of a database to store patient, employee, stock details etc. will accommodate easy access, retrieval, and search and manipulation of data. The access limitations provided through access privilege levels will enhance the security of the system. The system will facilitate concurrent access and convenient management of activities of the medical center.

3.1.1 System Interfaces

❖ Hardware Interfaces

- Laptop/Desktop PC-Purpose of this is to give information when Patients ask information about doctors, medicine available lab tests etc. To perform such action, it needs very efficient computer otherwise due to

that reason patients have to wait for a long time to get what they ask for.

- Laser Printer (B/W) - This device is for printing patients' info etc.
- Wi-Fi router - Wi-Fi router is used to for internetwork operations inside of a hospital and simply data transmission from pcs to sever.

❖ User Interfaces

- This section provides a detailed description of all inputs into and outputs from the system. It also gives a description of the hardware, software and communication interfaces and provides basic prototypes of the user interface.

❖ Software Interfaces

- VS-code: Visual Studio Code (VS Code) is a free, lightweight code editor developed by Microsoft. It supports many programming languages and has built-in features like syntax highlighting, IntelliSense (code suggestions), Git integration, and a powerful extension system. It's great for web development, Python, JavaScript, and more.
- MySQL: MySQL is an open-source relational database management system (RDBMS). It is used to store, manage, and retrieve data using SQL (Structured Query Language). MySQL is widely used in web applications, such as WordPress and online stores,

because it's fast, reliable, and works well with programming languages like PHP, Python, and Java.

- **PHP:** PHP (Hypertext Preprocessor) is a server-side scripting language designed for web development. It is widely used to build dynamic websites and works especially well with HTML and MySQL. PHP runs on the server and generates HTML that is sent to the browser.
- **HTML:** HTML (Hypertext Markup Language) is the basic language used to create and structure content on websites. It uses tags to define elements like text, images, links, and headings.
- **CSS:** CSS (Cascading Style Sheets) is a language used to style and design HTML content. It controls the appearance of web pages, including layout, colors, fonts, and spacing. CSS helps make websites visually attractive and responsive across different devices.

3.2 Product functions

- Provide access to registered users only.
- Registration of new patients.
- Enable patient to update their record.
- Generate appointment date and timing.
- Confirmation by doctor.
- Patients can do Payment.
- Modification in schedule by patient.

- Admin access to patient's record.
- Admin Verify Payment and Generate Bill/Receipt.

4. USE CASE DESCRIPTION

(1) PATIENT

* REGISTRATION

DESCRIPTION - The new patient can register themselves and add their details like name, age, gender, blood group etc. The patient entry will be made in the HMS database.

PRE -CONDITION – The patient must be a new patient, if necessary, fields left by user, then prompt user to fill the necessary fields.

MAIN FLOW OF EVENTS

1. Patient selects sign up in login module.
2. A registration form get displayed
3. Patient fills the required details.

POST CONDITIONS - Patient record is added to HMS database.

*PAYMENT

DESCRIPTION – It enables user to pay the consultant fee of Doctor online.

PRE-CONDITION - The patient must be a registered patient, If Patient don't wants to pay online he/she can pay by cash also.

MAIN FLOW OF EVENT

1. Patient first logs in to system.
2. View his/her record.

3. Appointment confirmed by the Doctor then go for Payment.

POST CONDITIONS – A receipt will be displayed. The HMS database is updated.

(2) DOCTOR

DESCRIPTION- The doctor view patient record/ update his details and add description of the treatment given to patient.

PRE-CONDITION – The doctor must be a registered doctor, System does not allow the doctor to modify the qualification, hospital managed details.

MAIN FLOW OF EVENTS

1. Doctor logs in to the system.
2. Doctor may select view patient.
 - 2.1 Patient record is displayed with treatment history.
3. Doctor add description of patient treatment.

POST CONDITION – The patient and doctor 's database are updated.

(3) ADMIN

DESCRIPTION - The admin add doctor, update doctor details and verify payment and generate Bill/Receipt for the same.

MAIN FLOW OF EVENTS

1. Admin logs in the system.
2. Admin may add doctor new doctor.
 - 2.1 admin fills the doctor's details.
3. Admin view Doctor record.
 - 3.1 Admin enters the doctor id in the system.

PRE –CONDITION - Admin must first log in with his/her credentials.

POST CONDITION - The HMS database is updated.

5. PERFORMANCE REQUIREMENTS

- o **Response time**- The system will give responses within 1 second after checking the patient information and other information.
- o **Capacity**-The system must support 1000 people at a time .
- o **User interface**- User interface screen will response within 5 seconds.

5.1 SAFETY REQUIREMENTS

If there is extensive damage to a wide portion of the database due to catastrophic failure, such as a disk crash, the recovery method restores a past copy of the database that was backed

up to archival storage and reconstructs a more current state by reapplying or redoing the operations of committed transactions from the backed-up log, up to the time of failure. All the administrative and data entry operators have unique logins so system can understand who is login in to system right now no intruders allowed except system administrative nobody cannot change record and valuable data.

5.2. SOFTWARE SYSTEM ATTRIBUTES

5.2.1 Usability: Software can be used again and again without distortion.

5.2.2 Availability: The system shall be available all the time.

5.2.3 Correctness: Bug free software which fulfils the correct need/requirements of the client.

5.2.4 Maintainability: The ability to maintain, modify information and update fix problems of the system.

5.2.5 Accessibility: Administrator and many other users can access the system but the access level is controlled for each user according to their work scope.

6. Literature Survey

1. Docpulse ->

Adaptable to different practice size-clinics, hospitals, and specialty canter. Reduces wait times with real-time scheduling and doctor availability. Centralized patient records with history, prescriptions, and reports. Built-in secure video consultations for remote care.

Disadvantage: A few users have experience delays in getting technical support or resolving issues, especially during peak hours. Some users reported that integration

with external lab equipment or third-party apps can be limited or require extra development effort.

2. AYUSH-HMIS ->

- Effective Clinical documentation. Effective data management including medical data retrieval. Supports full range of Data capture and Data management functions. Comprehensive collection of National Ayush Morbidity codes.

Disadvantage: Not all states or institution implement AYUSH-HMIS uniformly, leading to data fragmentation and inconsistent reporting across the country. Being a government-run platform, users often report slow response times for bug fixes or system upgrades.

- **“Hospital receipt management system” By Jeon Jun Ho -29 Oct 2020**

The receipt management system designed to help users efficiently manage bills and receipts. Key highlights include:

Purpose: Provides a centralized solution for organizing financial documents, reducing risks of loss or missed payments.

Components:

Management Server: Stores and organizes all bill and receipt data.

Communication Terminals: Devices like smartphones or computers that access the server for remote data retrieval.

Functionality: The server runs a program to manage data and ensure it is up-to-date and accessible on communication devices.

Benefits: Enhances organization, ensures timely payments, and prevents misplaced receipts.

Data Transmission: Offers email delivery of bills and receipts for added convenience. The system provides an efficient and integrated approach to financial document management.

- **“The Hospital Management System” By K. Nishanthan- 31 Oct 2022**

The introduction of the Hospital Management System paper highlights the urgent need for better management practices in hospitals. Here are the key points:

Objective of the Study: The main aim of the study is to create a digital management system that improves the

effectiveness of hospital operations and integrates different systems. This digital solution seeks to automate daily tasks, thereby lightening the workload for hospital staff and enhancing overall productivity.

Scope of the System: The introduction describes the features that the proposed system will offer, including modules for booking doctors, scheduling lab tests, managing pharmacy services, and overseeing health programs. These functionalities are intended to streamline processes and enhance service delivery to patients.

Significance of Automation: The introduction emphasizes the importance of automating hospital processes. By moving from manual to digital systems, the study aims to tackle the challenges hospitals face in managing records and transactions, ultimately leading to improved management and performance.

Research Methodology: While not elaborated upon in the introduction, it lays the groundwork for the research methodology that will be used to develop and assess the proposed system, guiding the researchers in their workflow and task organization.

- **“Receipt Management System” By Jang Hwang Jin, Kim Gui Hwa- 06 Apr 2000**

The paper offers a brief overview of a new receipt management system aimed at simplifying the handling of bills and receipts for subscribers. Here are the key points explained in detail:

Purpose of the System: The system is designed to provide an integrated solution for managing subscribers' bills and receipts. This means it helps users keep all their financial documents organized in one

20 | page

location, which can help prevent issues like losing important receipts or missing payment deadlines.

Key Components: The system consists of two main components:

Management Server: This server houses a database that records all relevant information about the subscribers' bills and receipts. It plays a crucial role in effectively storing and managing this data.

Functionality of the Management Program: The management server features a program that oversees the data related to bills and receipts. It also facilitates the transfer of this data to the communication terminals,

ensuring that users have the most up-to-date information at their fingertips.

Benefits of the System: By utilizing this integrated management system, users can avoid issues such as missing payment deadlines or misplacing receipts. The system's design promotes organization and ensures timely payments, which is essential for effective financial management.

7. Advantage of the system

HMS was introduced to solve the complications from managing all the paper works of every patient associated with the various departments of hospitalization with confidentiality. HMS provides the ability to manage all the paperwork in one place, reducing the work of staff in arranging and analysing the paperwork of the patients. Our project is fuelled by a deep motivation to bring about positive impacts in several key areas:

- 1. Centralized Record Management:** Enables a centralized repository for all receipts, which ensures easy access, tracking, and auditing. Facilitates compliance with legal and regulatory standards.
- 2. Enhanced Patient Experience:** Reduces waiting time during bill payments and receipt generation. Offers digital receipts and payment options for convenience.
- 3. Enhanced Data Security:** Protects sensitive patient payment information through the secure systems. Reduces the risk of fraud or unauthorized access to financial records.
- 4. Environmental Sustainability:** Encourages paperless operations by providing digital receipts, contributing to

eco-friendly practices. Reduces reliance on physical storage for old receipts.

- 5. Cost-Effectiveness:** Reduces the use of paper and manual resources, leading to cost savings in long term. Decreases administrative overhead by automating repetitive task.
- 6. Clear and Transparent:** Communication: generate clear, detailed, and easily understandable receipts, reducing patient confusion or disputes over charges.
- 7. Ambulance Service Provide:** Ambulance driver contact no are provide in the system following this information patient family can easily get the ambulance services.
- 8. Maintain account:** month and yearly based maintain account efficiently.
- 9. Generating Bills:** Automates the process of creating accurate and detailed invoices for patients. Which include room charges, Doctors visit, Nurse service bills, meals charge, bed charge, used medical supplies bills.

8. Challenges

Implementing and managing an **Hospital Management System** (HMS) involves several challenges across technical operational, regulatory, and social domains. Here are the key challenges:

- 9. Cost and resource Requirement:** It is a one-time investment. Which include hardware, software, training and maintenance expenses. Managing the costs and resources associated with HRMS systems requires careful planning, collaboration, and access to affordable technology. While the expenses can be

significant, effective solutions can make HMS implementation sustainable and beneficial for healthcare organizations of all sizes.

- 10. User Adoption:** User adoption refers to how well healthcare providers, staff, and other stakeholders accept and utilize an HRMS system. Despite the potential benefits of HRMS, many users struggle to adapt to these systems due to various technical, organizational, and psychological barriers. And that creates a confusion among the patient party and the staff.
- 11. Technical Challenges:** Interruption caused by maintenance, hardware failures can disrupt workflows and compromise patient care.
- 12. Secondary Storage:** Sensitive patient data requires secure storage to prevent unauthorized access. Risks of breaches during data transfer or storage can lead to compliance issues.
- 13. Security Problem:** Operating a hospital all details can require storage and database. So, it can cause implement issues for data.

13. Future of the System

The Future of Hospital Care and Management: HIMS for the Win

To take advantage of new technologies, many cities in parts of the world are being redesigned to become “smart” to create a secure, connected, and tech-enabled ecosystem for the citizens. Typically, these cities include future-ready smart hospitals. Such hospitals leverage new technologies and redesign their strategies to improve the patient experience, as well as care outcomes, and reduce costs. The technologies are used not only to improve care delivery within the hospital itself but also to automate the hospital’s manual processes.

- Constantly enhance feature & functionality to provide better serve to patients changing on demands. Features like telemedicine capabilities, technology like AI and ML.
- Including mobile application increase the HMS usability, that let medical professional consult patient data and get in touch with colleagues, get remain through mobile app.
- We will add more section like equipment’s details store information in hospital.
- Graphical interface improvement.
- Add a option to tack online appointment it help patients cut the long queue and save the time & add feature like automated email and text massage.
- Patients call consult with the doctor through the video call if emergency or pandemic situation occur.

14. Conclusion

After analysing and surveying some of the popular pre-existing Health Management System in the market, we have come to the conclusion that there are some to those projects which can further be solved by different approach. So, we have come with several ideas to tackle the problems with more optimized methods that are to be implemented in the project.

The ‘HealthVault’ (Health management system) application is reducing manual work and provides efficient ways for strong and retrieving of electronic medical records. HMS system is the combination of document management features, including information retrieval, ensures that healthcare professionals have quick access to relevant patient data. Moreover, the system's statistical and reporting functions empower hospital management to make informed decisions, fostering continuous improvement in both performance and service quality. By embracing these outstanding features, a hospital reception system becomes a pivotal tool in creating a patient-centric, organized, and efficient healthcare environment.
